Software Center

WELCOME TO A DIGITAL MEETING

Continuous Compliance

an introduction

November 20, 2026 | **13:00-13:30** | **Digital meeting** | **Registration for the meeting**

***CONTINUOUS COMPLIANCE** is the newest project initiated by Software Center and with additional funding from Vinnova through the program Advanced Digitalization. The overall objective of the project is to enable continuous, automated, and scalable regulatory compliance for software-intensive systems, thereby reducing compliance burden while strengthening innovation capacity and industrial competitiveness. The project is expanding in Q1 2027; additional activities and partners are welcome!*

The Continuous Compliance project aims to transform traditional, manual compliance practices into automated, lifecycle-wide processes for software-intensive systems.

By combining AI-enabled automation, advanced computation, and connectivity, the project will enable continuous regulatory interpretation, automated compliance evidence generation, and real-time monitoring as regulations and systems evolve.

Focusing on safety, cybersecurity, privacy, and AI regulations, the project addresses technical solutions, organizational processes, and regulatory interactions. Industrial demonstrations will establish reusable solutions, infrastructures, and practices across key Swedish industrial sectors.
